Lakes are sentinels, regulators and integrators of climate change (Williamson et al, 2009)

- Many lake hydrological and biophysical variables are potential **indicators of current climate change**
- Lakes **regulate** greenhouse
- Lake sediments are archives of past climate (**integration**)

Lakes Essential Climate Variables requirements (GCOS):

- Daily water **level** changes
- Daily water **extent** changes
- Weekly water **temperature**
- Weekly Water **colour**
- Freeze-up / break-up dates, monthly **ice** thickness

- Are these variables **measurable** from remote sensing **with sufficient confidence** to address climate questions?

- Need for **large and long observation dataset** to **disentangle natural and anthropogenic change**

→ Provide the first consistent, longest attainable time-series of the largest possible number of lakes covering all parameters under the Lakes ECV

Users are
interested in
multiple lakes
parameters

User Requirements on spatial aggregation

User requirements on temporal resolution

Project Dataset

Limitations:

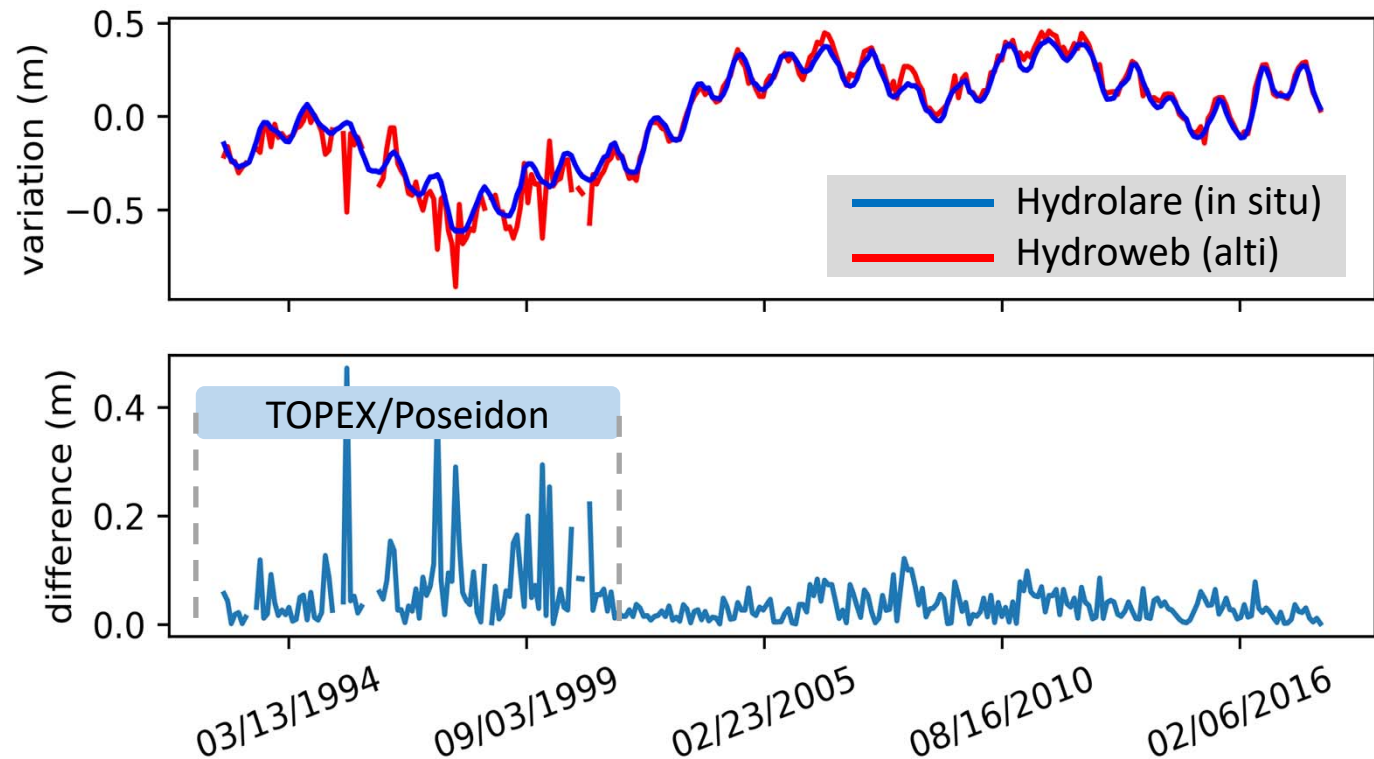

- Observations are not synchronous,
- revisiting times differ,
- there are continuity issues (no-sensor gaps)
- There are standards discrepancies
- newer satellites offer more capabilities
- ...

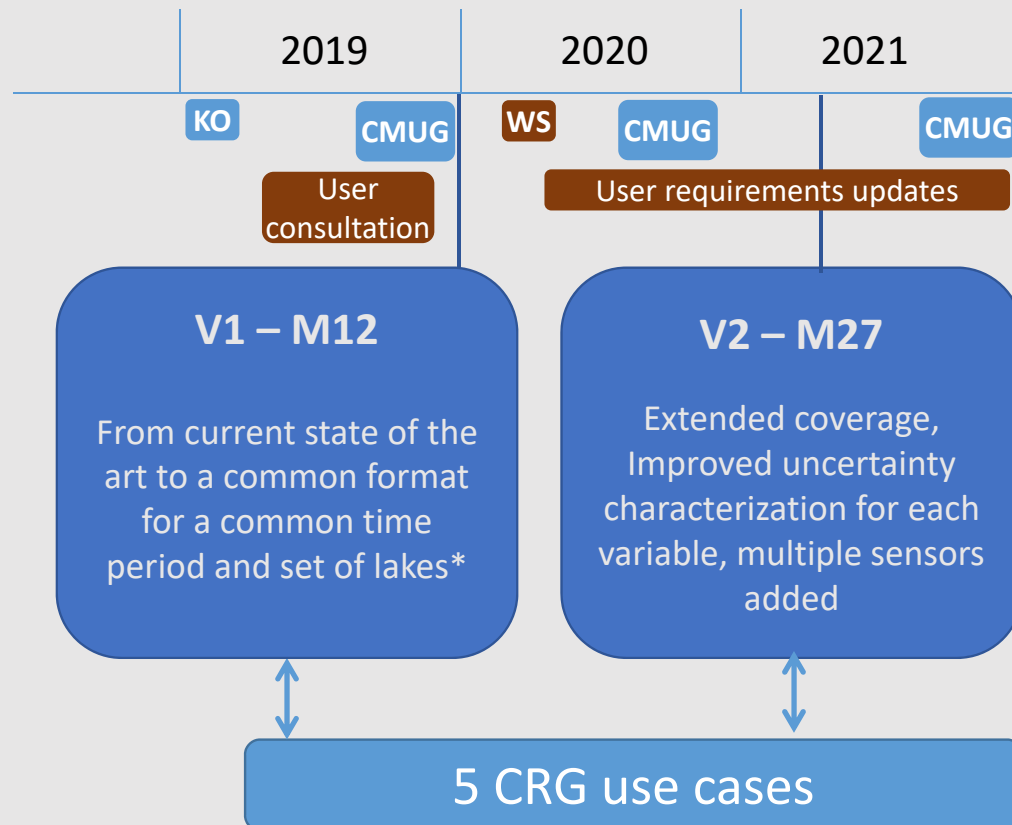

Example:

- Comparison between lake water level from altimetry (Hydroweb) and in situ (Hydrolare)
- → Uneven performance of altimetry dataset
- → Product should be improved thanks the TOPEX/Poseidon reprocessing

Lake Water Level – Issyk-Kul

Innovations per production team:

- Adding satellite sensors into data set
- Improving **uncertainty characterization**
- Innovations for Lakes ECV consistency:
 - Optimizing **common output grids**
 - Identifying prominent data gaps
 - **Common and broad climatic coverage**
- Input (priorities) from CRG, CMUG and other user groups essential for v1 -> v2 evolution

climate change initiative

→ LAKES

Outlook

- The variables needed to understand the role of the lakes in climate change are numerous: level, extent, temperatures, ice, water colour ...etc
- A single consistent resource for Lake ECV data will be established thanks to remote sensing techniques: major challenge to align techniques and products
- Complementarity with in situ in terms of products and validation
