

# Absolute calibration of SARAL-Altika and Jason-2 over Kavaratti Island in Arabian Sea

By

Space Applications Centre (ISRO)

List of authors:

K. N. Babu, Shukla, A. K., Suchandra, A. B., Bonnefond, P., Mehra, P.

## **Objectives**

- Is to calibrate AltiKa and Jason-2 over Indian region of the global ocean
- Global relative calibration of AltiKa with Jason-2 altimeter

## **Collaborative Institutes:**

- **National Institute of Oceanography, CSIR, Goa**
- **Department of Science and Technology, Kavaratti**

# Global sea surface height - AltiKa

## Permanent altimeter calibration sites

- A – Corsica, Ibiza, Gavdos (Northern hemisphere)
- B – Harvest (Northern hemisphere)
- \* C – Kavaratti (Equatorial zone)
- D – Bass strait (Southern hemisphere)

## At Kavaratti site:

Pass #539 passes over west of Kavaratti site. The 11 cycles of AltiKa have spread over ~2Km along the altimeter track, and hence its absolute bias with respect to the in-situ observations.

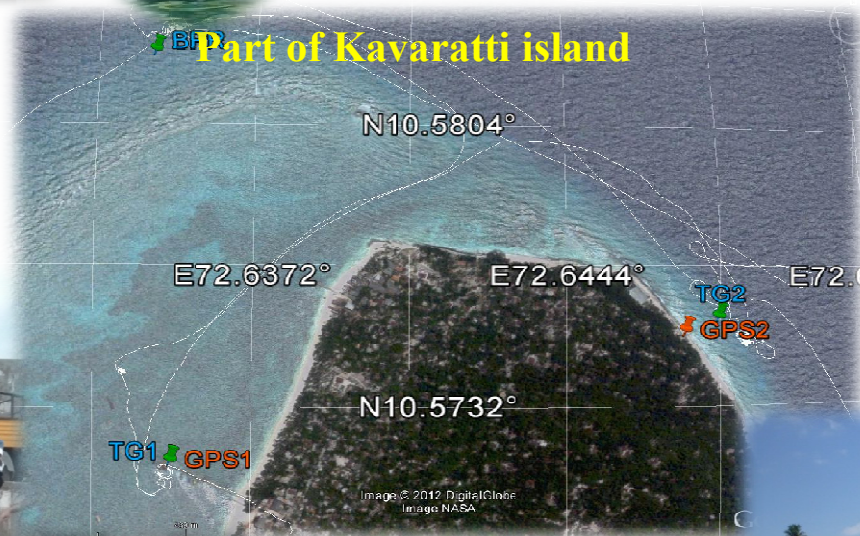

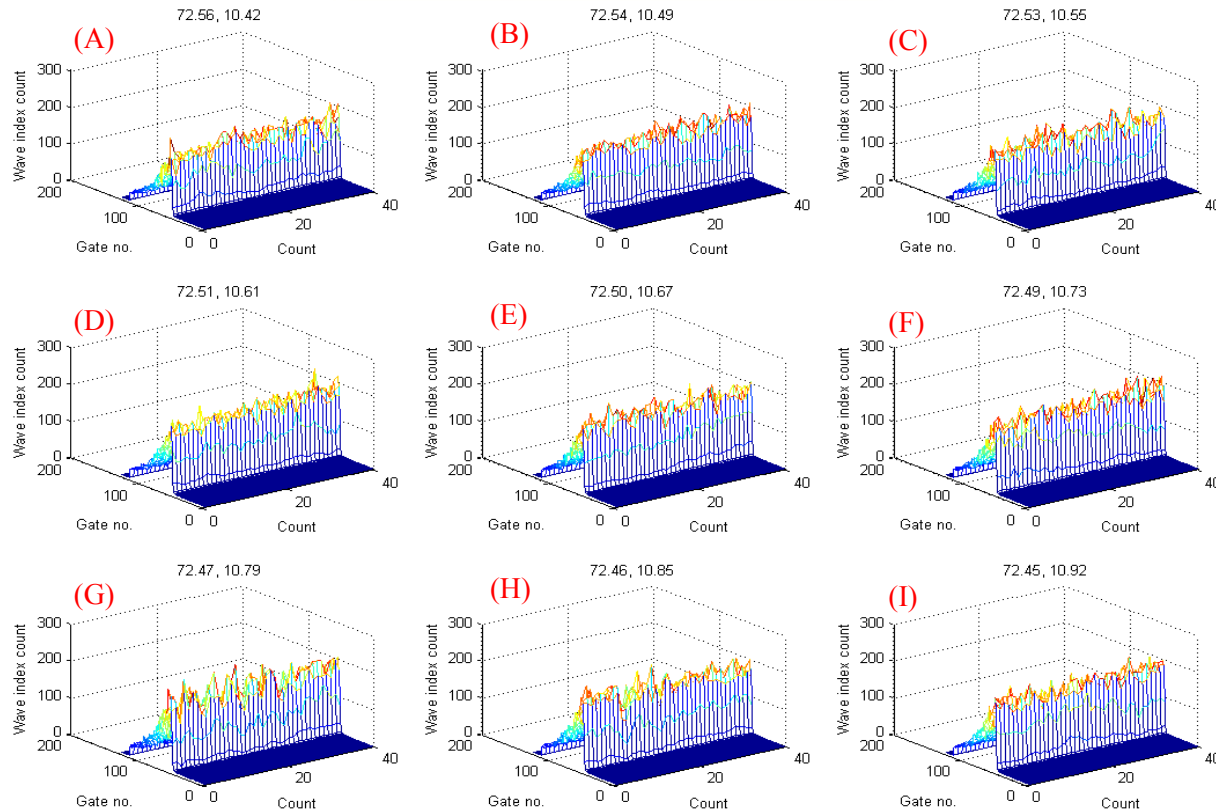

Geoid height difference (crossover->tide gauge) from EGM08: -9.1cm  
 Geoid height difference (crossover->tide gauge) from GPS-buoy: -17.2cm => **value used**

# Kavaratti calibration site

## Kavaratti calibration site

## Criteria for a good calibration site

- ❖ Altimeter should fly over the site
- ❖ The site should be located sufficiently far offshore so that the area of illumination should cover entirely by ocean when the satellite is directly overhead
- ❖ The data collection platform should be small enough so that it cannot influence the reflected radar signal
- ❖ Island stations are better, since they are away from the effects of shallow water
- ❖ Ultimately site at open ocean environment is best for these missions under which they are designed to best operate

# SARAL AltiKa: Calibration

## Level -2 Saral/AltiKa products

|                         | OGDR          | IGDR         | GRD          | GOALS |
|-------------------------|---------------|--------------|--------------|-------|
| Sea surface height (cm) | 30.5cm (req.) | 5.3 cm(req.) | 4.6 cm(req.) | 2.8cm |
| Latency period          | 3 – 5 Hours   | < 1.5 days   | ~40days      |       |

## Radar tide gauge specifications

| Sensor                            | Range   | Accuracy   | Sampling interval | Data transfer |
|-----------------------------------|---------|------------|-------------------|---------------|
| Radar level sensor (OTT, Germany) | 1 – 30m | $\pm 1$ cm | 5 minutes         | GSM modem     |

## AltiKa calibration method

*“The principal of the method is to estimate the bias by means of comparison of altimetric sea surface height information to adjacent tide gauge sea surface height data located within the same geodetic reference frame”.*

## **Interpolation schemes in absolute calibration (adapted from Bonnefond et al. 2011)**

## Verification of tide gauges using GPS buoy

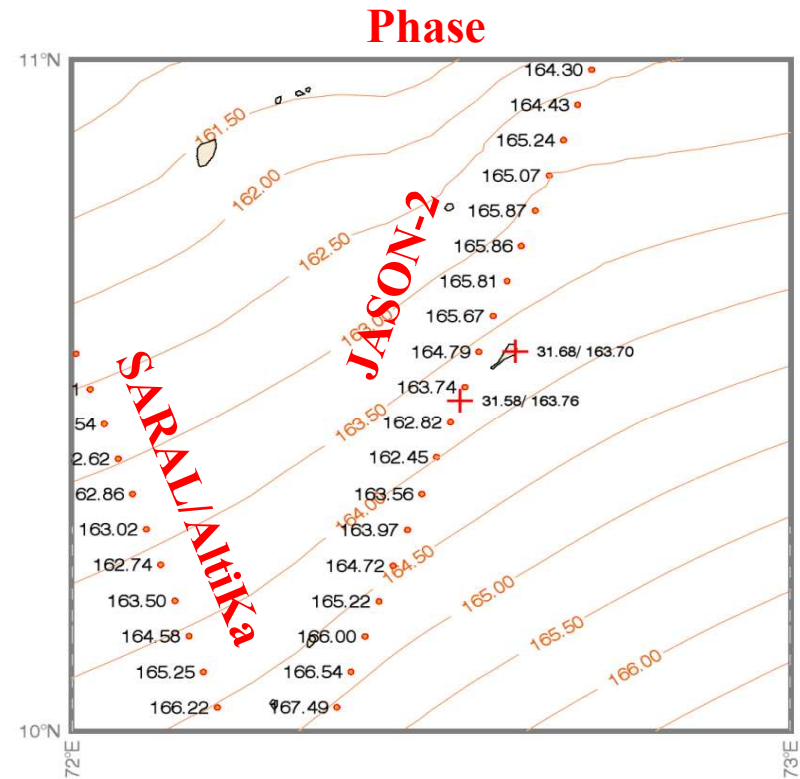

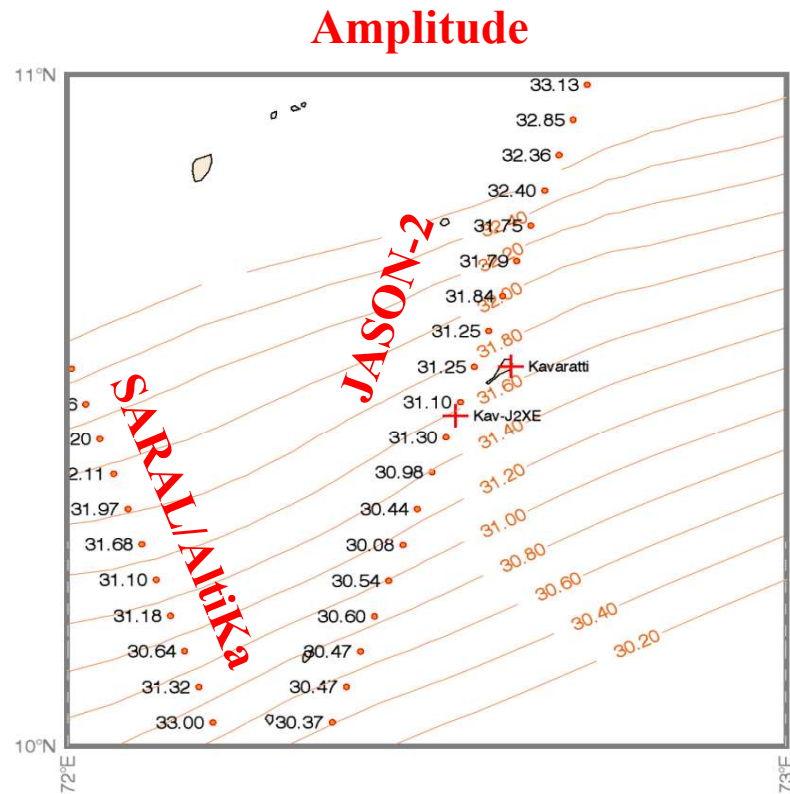

Sea surface height from GPS buoy solution (red line), tide gauge (light green) at Kavaratti main jetty

Sea surface height GPS buoy (red, purple, magenta), main jetty tide gauge (light green) and NIOT tide gauge (dark green)

## FES2012 – 1/36°

Similar results are found when we used FES2004, GOT4.7 and TPXO7.2 models. The difference both in magnitude and phase are  $\sim 2\text{mm}/\sim 1^\circ$  for the distance of 12km at this site.

The difference of interpolated mean dynamic topography between the tide gauge locations (M1/M2) and crossover point is 1.4mm/1.1mm

| Absolute bias      | $-48 \pm 32\text{mm (M2)}$ | $-1.52 \pm 41\text{mm (M1)}$<br>$18.9 \pm 36\text{mm (M2)}$ |

### Conclusion

1. The Kavaratti calibration site measurements are used to do absolute calibration of Jason-2 and SARAL/AltiKa altimeters
2. The variations in tide and mean dynamic topography are very less though, the island is situated on a seamount
3. The absolute SSH bias of AltiKa GDRT product is  $-48 \pm 32\text{mm (M2)}$  and Jason-2 (GDR) is  $-1.52 \pm 41\text{mm (M1)}$ / $18.9 \pm 36\text{mm (M2)}$
4. The global bias of AltiKa against Jason-2 in IGDR product is 5.3/4.0cm in its 10/25km collocation
