### Introduction

#### Sea State Bias (SSB)

- Geophysical altimetric correction caused by the influence of local sea-state in the altimetric radar pulse
- SSB = Electromagnetic Bias + Skewness Bias + Tracker Bias
- Centimeter-scale measurement (≈30cm) remains as one of the largest source of uncertainty of the altimetric signal

#### Motivation

- Development of a new global and multi-mission SSB model based on parameters solely derived from altimetric data
- Regional studies of SSB for different sea state regimes. Planned to implement in the forthcoming missions.

OSTST October 20-23, 2015

### Background information

- The usual estimates of SSB are obtained using empirical models derived from analysis of altimeter data
- Parametric, nonparametric and hybrid models
- 2D SSB: Significant Wave Height (SWH), Wind Speed (WS) [Gaspar et al., 2002; Scharroo and Lillibridge, 2005]
- 3<sup>rd</sup> predictor: Mean Wave Period (Tm) from WW3 [Tran et al., 2010]

#### OSTST October 20-23, 2015

## Background information

- Approaches to retrieve wave period information (Tz), 2 algorithms tested:
  - G03 (SWH,  $\sigma_{Ku}^0$ ) [Gommenginger et al., 2003]
  - Q04 (SWH,  $\sigma_{Ku}^0$ ,  $\sigma_C^0$ ) [Quilfen et al., 2004]
- Direct Method [Vandemark et al., 2002]
  - SWH and WS binning of SSHA
  - Good and reliable SSB estimation
- Generalized Additive Models with Smoothing Splines
  - Flexibility, ease of implementation, computational requirements, extensibility and accuracy results

$$- y_{i} = \beta_{0} + f_{1}(x_{i1}) + f_{2}(x_{i2}) + \ldots + f_{p}(x_{ip}) + \epsilon_{i}$$

#### OSTST October 20-23, 2015

### Model design

- 1 Data extraction, limits and criteria
- Ocean wave period estimation and analysis
- ${\rm (3)}~{\rm SSHA}\approx{\rm SSB}$  estimation with Direct Method
- 4 Model selection, checking and outliers removal
- S New SSB UPT predictions

OSTST October 20-23, 2015

### Ocean wave period analysis

- Algorithms G03 and Q04 were selected due to their simplicity, ease of implementation and good agreement when compared with buoy measurements
- Mean Wave Period  $T_z = \sqrt{m_0/m_2}$  using the wave spectral moments of WAVEWATCH 3 obtained from RADS

• Swell Ratio (SR): (*Swell\_Height/SWH*<sub>WW3</sub>) < 0.9

#### OSTST October 20-23, 2015

### Ocean wave period analysis: SR < 0.9

### SSHA estimation with Direct Method

- SSH uncorrected for SSB binned against WS and SWH
- $SSHA(WS, SWH)_{bin} = \langle (SSH MSS) \rangle_{bin}$
- 2 MSS used: DTU10 and DTU13
- Bins width of 0.25 m/s in WS and 0.25 m in SWH
- Large noise in the extremes of the SSHA domain for high SWH and WS values decreasing with the number of cycles involved in the binning estimation

#### OSTST October 20-23, 2015

### SSHA estimation with Direct Method

CUP::UPORTO

10 / 26

#### OSTST October 20-23, 2015

### Model design

- 1 Data extraction, limits and criteria
- Ocean wave period estimation and analysis
- ${\small \textcircled{\sc ssmallel{SSHA}{3}}}$  SSHA  $\approx$  SSB estimation with Direct Method
- 4 Model selection, checking and outliers removal
- S New SSB UPT predictions

## SSB modeling with smoothing splines and GAMs

- Training dataset estimated for the first 3 years of Jason-1 (112 cycles)
- Careful selection criteria for bins validation and weighting
- Outliers removal based on residual analysis
- 2 approaches considered:
  - $SSB_{i} = \beta_{0} + f_{1}(SWH_{i}) + f_{2}(U10_{i})$
  - $SSB_{i} = \beta_{0} + f_{1}(SWH_{i}) + f_{2}(U10_{i}) + f_{3}(SWH_{i}, \sigma_{Ku}^{0})$

### Conclusions and future work

- This is a study in progress
- Reliable model easy to handle and control, flexible enough to be adapted in other missions
- Other Tz derived methods should be tested in the future
- Model design can be improved with additional predictors, fine tunning and calibration methods
- Push to the limit with smaller training datasets
- Regional studies for different sea state regimes and altimeter ocean observations from other sensors
